Figure 1 is a line graph showing the distribution of the number of non-zero elements in the vector z . The x-axis represents the number of non-zero elements, ranging from 0 to 128. The y-axis represents the probability, ranging from 0.00 to 0.02. The graph displays two distributions: a theoretical distribution (green line) and an empirical distribution (red shaded area). The empirical distribution is slightly wider than the theoretical one. The peak of the distribution is labeled "2.00% - 2.00%".

Figure 1 shows a cross-section of a road embankment. The embankment is depicted in red, with a green line indicating the ground surface. The top of the embankment is marked with a width of 5.00m and a height of 2.00m. The structure is supported by a concrete foundation. The diagram includes various dimensions and labels for the different parts of the structure, such as the embankment width, height, and the concrete support structure.

The graph displays the probability density function (PDF) of the sum of two independent random variables, X and Y . The x-axis represents the sum $Z = X + Y$, ranging from 0.0 to 2.0. The y-axis represents the probability density, ranging from 0.0 to 0.5. The PDF is a triangular distribution with a peak at $Z = 1.0$. The area under the curve is shaded in red. The peak is labeled '200% 200%'.

The graph illustrates the probability of a stock price exceeding a threshold of 100 over time. The x-axis represents time from 0 to 100, and the y-axis represents the probability from 0.00 to 0.10. A green line represents the probability, which starts at 0.00, rises to a peak of approximately 0.08 at time 50, and then declines back to 0.00. A red shaded area under the green line represents the probability of the stock price exceeding 100. A green arrow points to the peak of the curve, labeled '2.00% 2.00%'.

Figure 1 is a line graph showing the trend of the average number of visits per day (Y-axis) versus the number of days after the outbreak (X-axis). The Y-axis ranges from 0 to 1200, and the X-axis ranges from 0 to 12. The curve starts at approximately 500 on day 0, rises to a peak of about 1100 on day 4, and then declines to about 500 by day 12. A red shaded area under the curve is labeled '2.00E+006'.

Figure 1 is a cross-sectional diagram of a roadbed with a 1:1 slope. The diagram shows a red roadbed cross-section with a green line representing the ground surface. The roadbed has a top width of 10.0m and a base width of 10.0m. The slope is 1:1. The diagram is divided into three sections by vertical lines. The left section is labeled '路基' (Roadbed) and '路面' (Road surface). The middle section is labeled '路基' (Roadbed) and '路面' (Road surface). The right section is labeled '路基' (Roadbed) and '路面' (Road surface). The diagram includes dimensions for the roadbed width, slope, and ground surface elevation. The ground surface elevation is marked as 10.0m, 9.5m, and 9.0m. The roadbed width is marked as 10.0m, 10.0m, and 10.0m. The slope is marked as 1:1, 1:1, and 1:1. The diagram also includes a scale bar and a north arrow.

The graph displays the average number of infected individuals over time. The x-axis ranges from 52.58 to 54.10. The y-axis ranges from 0 to 12.46. A green line represents the average number of infected individuals, which peaks at approximately 12.46 around time 53.75. A red shaded area represents the 2.00% confidence interval, which is centered around the peak. A horizontal line at the peak is labeled '2.00% 2.00%'.

Figure 1 is a line graph showing the estimated probability of a 2008 US Presidential election outcome based on the number of states won by the Democratic candidate. The x-axis represents the number of states (51 to 54), and the y-axis represents the probability (0.00 to 0.50). A green line shows the estimated probability, which peaks at 0.50 for 52 states. A red shaded area represents the 2.00% confidence interval, which is centered around 52 states. The graph is labeled "2.00%" at the peak.
